

USER'S MANUAL AND PROGRAMMER'S GUIDE
FOR
DDMERG/DDCONV: DATA DICTIONARY MERGING AND CONVERSION PROGRAMS

by

P.C. Bera

ABSTRACT

This is a manual for the computer codes DDMERG (Data Dictionary MERGe) and DDCONV (Data Dictionary CONVersion). DDMERG is a tool to merge two or more data dictionaries into one which is used to check and insert variable definitions into FORTRAN code. DDCONV is another tool to convert a data dictionary from ASCII to MASS-11 word processor format and vice versa; one of its main uses is in writing module specifications.

DDMERG and DDCONV are menu driven codes that write the output to a user specified file(s). They were developed in a VAX/VMS environment, and are portable to most other platforms.
